NEW ABSTRACT

A luminaire includes a light source for producing light radiation leaving the luminaire through its front side. The luminaire further includes a dome-like concave reflector around a central axis perpendicular to the front side. A tubular louver is positioned around the central axis in front of the light source and is located at least partly inside the concave reflector. The louver has a substantial tubular wall, and both sides of the wall have a light reflecting surface. The louver is connected with the remainder of the luminaire through connection device, which is substantially located in the area of the luminaire behind the louver. The connection device engages the back edge of the louver, where the louver back edge is directed to the light source.
